

Common Scan for the OR

The Challenge

In recent years, many hospitals have made a commitment to improve inventory accuracy in the operating room. However, its fast-paced environment presents unique challenges to both providers and pharmacists. Without a “best practice” in place, facilities often face inventory discrepancies, missed charge capture and stock outs, despite automated dispensing cabinet (ADC) use.

The Solution

To help account for perioperative medication usage, Codonics Safe Label System (SLS) integrates with leading ADCs to improve tracking distribution and use of medications in the OR. Through a single “common scan” on SLS, the dispense is automatically decremented from the cart’s inventory. Highly accurate and completely automated, this process provides pharmacy with unprecedented confidence for inventory reporting and 340B accountability. This integration often requires little to no IT resources.

- Significantly reduces inventory discrepancies
- Increases charge capture
- Helps eliminate stock outs
- Reduces medication stocking time
- Enables pharmacies to reallocate FTE for other duties

Proven Results

Codonics recently worked with a renowned children's hospital that does approximately 30,000 procedures a year. After a four month trial, they not only improved safety and compliance, but saw how quickly they could realize a return on investment (ROI). Quickly standardizing on SLS with common scan integration on their ADCs throughout their 53 operating theaters, they experienced the following:

- 37% improvement in missed charge capture
- Estimated savings of \$384,000 in the first year (about \$7,200 year per OR)
- Significantly improved user satisfaction
- 100% TJC compliance

Additional features of common scan integration

SLS Advanced Smart Scanning (SASS)

The SLS Advanced Smart Scanning (SASS) feature enhances the common scan workflow by supporting accounting and charging for most items in the ADC. This feature enables each site to determine whether or not to print a label. SASS allows a container to be scanned and then print a label, not print a label, or allow printing of an SLS label. For example, scanning a prefilled syringe and hearing SLS announce the drug name and concentration without printing a label to better ensure the correct drug was selected even when there is no need for a printed label. In either case, SLS announces the drug name and concentration for safety.

Confidence in the OR

Safe Label System is the standard of care in the world's leading hospitals, being used nearly 8,000 ORs and has helped to prevent more than 550,000 medication errors.

Improve Charge Capture with SASS

As many inventory items are never tracked to a patient once removed from an ADC, SASS provides an opportunity to help hospitals improve charge capture. When integrated with an ADC, this feature also decrements inventory of those items scanned on SLS. For example, it allows a user to scan non-drug containers (e.g. catheters or other costly supplies) that have barcodes on their packaging without printing an SLS label but still automatically decrement the inventory in the ADC, providing a complete and accurate inventory report.
